Mastercard Processing Core APIs

Copy to Markdown

Overview

Mastercard Processing offers modern, scalable, and configurable card processing solutions to fintech companies and financial institutions. This program supports a wide range of consumer and commercial payment products. Our processing services are available to issuers through Open Application Programming Interfaces (APIs), allowing them to build **Digital First** card programs and secure payment instruments for cardholders.

How It Works

Mastercard Processing services are available through RESTful Open APIs that allow issuers to build modern payment solutions and design stellar user experiences.

The APIs cover the entire product lifecycle. It starts from setting up a client and address, to creating accounts and ordering a card that can be instantly tokenized. Many mobile PAYs and wearables are supported, including Apple, Google, Samsung, Xiaomi, Fitbit, Garmin, Swatch, Card on File, and issuer Wallet (HCE).

Digital First cards can be issued with a physical option. Multiple physical cards and designs are available, including various shapes and materials such as platinum, metal, and eco-friendly materials.

The APIs support the full account, card, and token lifecycle, including card activation, temporary blocking, usage limits and spending controls, and other automatic events.

The APIs can also be leveraged throughout the transaction lifecycle, from authorization through transaction clearing, dispute management, and fraud prevention rules management.

The APIs can also be used to manage credit card and installment loan lifecycles, including payments, funds transfer, transaction history and statements, direct debits, account delinquency, and more. Several operations support various aspects of card products and value-added services.

NOTE: For your convenience, the Mastercard Processing APIs has been divided into smaller logical parts (for example Core APIs, Digital APIs, Dispute APIs, and so on). Each part has a separate specification and technical documentation.

In this documentation, Mastercard Processing Core APIs are described. Mastercard Processing Core APIs cover a set of APIs used for any card product (prepaid, debit, credit, or commercial) management, such as:
